SIGNIFICANT FIGURES

The digits in a measured quantity which are reliable and confidence in our measurement + the digit which is uncertain.

RULES FOR SIGNIFICANT FIGURES

1. All non-zero digits are significant. For example, 42.3 has three significant figures; 243.4 has four significant figures; and 24.123 has five significant figures.

2. A zero becomes significant figure if it appears between two non-zero digits. For example, 5.03 has three significant figures; 5.604 has four significant figures; and 4.004 has four significant figures.

3. Leading zeros or the zeros placed to the left of the number are never significant. For example, 0.543 has three significant figures; 0.045 has two significant figures; and 0.006 has one significant figure.

4. Trailing zeros or the zeros placed to the right of the number are significant. For example, 4.330 has four significant figures; 433.00 has five significant figures; and 343.000 has six significant figures.

5. In exponential notation, the numerical portion gives the number of significant figures. For example, 1.32×10^{-2} has three significant figures and 1.32×10^4 has three significant figures.

RULES FOR ROUNDING OF A MEASUREMENT

1. If the digit to be dropped is less than 5, then the preceding digit is left unchanged. For example, $x = 7.82$ is rounded off to 7.8 and $x = 3.94$ is rounded off to 3.9.

2. If the digit to be dropped is more than 5, then the preceding digit is raised by one. For example, $x = 6.87$ is rounded off to 6.9 and $x = 12.78$ is rounded off to 12.8.

3. If the digit to be dropped is 5 followed by digits other than zero, then the preceding digit is raised by one. For example, $x = 16.351$ is rounded off to 16.4 and $x = 6.758$ is rounded off to 6.8.

4. If the digit to be dropped is 5 or 5 followed by zeros, then the preceding digit, if it is even, is left unchanged. For example, $x = 3.250$ becomes 3.2 on rounding off and $x = 12.650$ becomes 12.6 on rounding off.

5. If the digit to be dropped is 5 or 5 followed by zeros, then the preceding digit, if it is odd, is raised by one. For example, $x = 3.750$ is rounded off to 3.8, again $x = 16.150$ is rounded off to 16.2.

RULES FOR ROUNDING OF A MEASUREMENT
